A briefe Treatise

containing many proper Tables and easie Rules.

Very necessary and needful, for the vse and commoditie of all people: First collected out of certaine learned mens workes,

By Richard Grafton.

And now newly perused, corrected and in many places augmented this present yeare 1602.

The Contents whereof, the leafe that next followeth doth expresse.

LONDON
Printed for *Thomas Adams*, dwelling in *Paules Church-yard at the signe of the white Lion. 1602.*

The contents of this booke.

First, a rule to know the beginning & ending of the Termes both spirituall and temporall. 5 & 8.
A Kalender perpetuall, shewing what signe and degree the sun is in euery day of the yeere. 9
An instruction for the perfect vnderstanding of the computation. 21
A new and more briefe account of the yeeres of our Lorde, then hath beene before set forth, agreeing with the yeares of all the raignes of the kings of this Realme, since the conquest, whereby readily yee may finde the yeere of our Lorde, the Prime, the Epact, the Sundayes letter, the Leape yeere, the beginning of euery kings raigne, & the number of yeeres that they raigned, and also yee may quickly vnderstand the account of the yeeres of any euidence. 23
An euerlasting table to finde the Sundayes letter and an other for the Prime and Epact. 53
A rule to know the age of the Moone, her full. change and quarters for euer. 56
A Table to know how long the moone shineth, and when she riseth and setteth. 58
A rule to know the true houre of the night, by the shadow of the Moone in any sun diall. 60
A rule to know the houre of the day, by the beames of the sun, and length of the Ruler. 61
A Table to finde for euer the feasts of Easter, and all other moueable feastes, as well for any yeere past as any yeere to come. 64
A rule to know the Dog dayes. 66
An Almanacke for xxxii. yeeres to come, wherein yee may readily finde the moueable feasts. 67. & 68.
A rule to know the vigils and fasting dayes, throughout the yeere. 69

A rule to know how many dayes euery moneth hath. 69

Certaine tables to know the ebs and floudes, for moſt portes and hauens in England enlarged. 70

A rule to know by hart, what member is gouerned by any of the 12. ſignes. 76

A Table to ſhewe what ſigne the Moone is in, and ſhall be for euer, alſo what part of mans body the ſigne doth rule, & what infirmities are incident thereto. 77

An eaſie way to knowe what ſigne the Moone is in. 79

Certaine elections that are to bee choſen by the courſe of the Moone. 80

Certaine tables that ſhewes the ryſing and ſetting of the Sunne, the length of the day and night, artificiall &c. 82

A table to knowe what Planet rules euery houre eyther by day or night. 85

A table to know the length of the Planetary houres. 86

A figure ſhewing the ſame more eaſie and readier without tedioulneſſe. 88

The properties & inclinations of the Planets. 90

The names of all the Colledges and halls, in both vniuerſities Oxford and Cambridge. 95

The ſhires, cities and boroughes, that haue place in the Parliament with all the parish Churches contayned in each ſhire. 99

The names of all the biſhoprickes in England and Wales. 102

The names of the Wardes and Parishes in London. 105

All the principall Faires in England. 107

All the Faires of Wales neuer before printed. 116

The highwayes from one towne to another much larger then hath beene heretofore ſet forth. 122

Michaelmas Terme.

S. Luke.
S. Simon & Iude.
S. Fayth.
S. Edwarde.
All Saintes:
S. Martine.
Edmond K.
S. Katherin.
S. Andrew.
The conception of our Lady.

Yee must well vnderstand that the first day ensuing, each of the feastes set downe before euery Terme, the court of the Arches is kept in the forenoone at Bowe church: and in the afternoone the same first day, is kept in Southwarke the Admirall court for ciuill causes.

The second day after each of these feasts, the Audience court of Canterburie, is held in the Consistorie in Paules in the forenoone, and the prerogatiue court of Canterburie is kept in the same place in the afternoone the same day.

The third day following any of those feasts, the Bishop of Londons Court of Consistorie is holden in Paules in the forenoone, and in the same place is the court of the Queenes highnesse commissioners vpon appeales, and the Court of Delegates holden in the after noone the same third day.

Hillarie Terme.

S. Hillarie.
S. Wolstanet
Conuert. of Paul.
S. Blase.
S. Scolastice.
S. Valentine.
Ashwednesday.
S. Matthias.
S. Chadde.
Perpet. & Feli.
S. Gregorie.
Ann. of our la.

Lawe dayes.

Understand that the foure first feasts of this Terme be neuer changed, but are certaine, the other are sometime kept, and sometime omitted, after the course of the yeere altered. And if it so chaunce, that one of those feasts be Ashwednesday, that are after saint Blase day, so that the same lawday after Ashwednesday cannot be kept, because the Lawdaye of the other feast dooth light on the same day: the second lawe day after Ashwednesday shall be kept, and the other omitted.

And if the lawe day after Ashwednesday be the next day after S. Blase, than shall all and euery of those dayes be obserued in order, as they may be held conueniently.

And note, that although Ashwednesday be the vii. in order, yet it hath no certaine place, but is chainged as the feast of Easter causeth it.

Easter Terme.

The xv. day after Easter.	Gordian.
Saint Alphege.	Saint Dunstone.
Saint Marke Euangelist.	Ascention day.
Inuention of the Crosse.	

In this Terme, the first sitting is alwayes kept the Monday being the xv. day after Easter, and so after the feasts here noted, which shall next follow by course after Easter, and the like space being kept betweene other feasts, the rest of the Law dayes are kept the third day after the Ascension, which is the last of this Terme. And if it happen that the Ascension day do come before any of those feasts aforesayde, then they are omitted for that yeere. And likewise, if any of those dayes come before the 15. day after Easter, those dayes are also omitted.

Trinitie

Trinitie Terme.

Trinitie sunday.	S. Botulph.	S. Swithin.
Corpus Christi.	S. Iohn.	S. Margaret.
Boniface Bishop	S. Paul.	S. Anne.
S. Barnabe.	Tr. S. Tho.	

Remember that the Law dayes of this Terme are chaunged by the meanes of Pentecost, and the first sitting is holden alwayes the first day after Trinitie Sunday, and the second lawe daye is holden the first day after Corpus Christi day, except it fall on some day above named, which chanceth sometime, and then the fitter day is kept, and after the second session account fourt dayes or therabout, and then looke which is the next feast, and the first law day after the sayd feast, shall be the third session, the other lawe dayes follow in order, but so many of them are kept, as for the time of the yeere is thought meete.

Note generally, that every day is called a lawe day, that is not Sunday or holiday, and that if the feast day being knowne of any Court daye in any Terme, and the first or second daye following bee Sunday, then the Court day is kept after the sayd holyday or feast day.

Fyrst of all, these dayes are not altered, except they light on Sunday, or some Holy day, and every day is called a Lawe day, unlesse it be Sunday or holy day.

A necessary and perfect rule to know when the Termes begin and end: and how many returnes are in euery Terme.

Eight dayes before any Terme be
the Eychequer openeth for certainties
Except the Terme of Trinitie
That openeth but foure dayes before truly.

Hillarie Terme beginneth the 23. of Januarie, if it bee not Sunday, then the next day after, and endeth the 12. of Februarie.

Octabis Hillarij.	Crastino Purificat.
Quind. Hillarij.	Octabis Purificat.

Easter Terme beginneth xviii. dayes after Easter and endeth 4. dayes after Ascention day.

Quind. Paschæ	Mense	Quinq; Paschæ.
Tres Paschæ.	Paschæ.	Crastin. Ascention.

Trinitie Terme beginneth the next day after Corpus Christi day and endeth the wednesday fortnight after. Note that Corpus Christi day is alwaies the Thursday after Trinitie sunday.

Crast. Trinitatis.	Quind. Trinitatis.
Octab. Trinitatis.	Tres Trinitatis.

Michaelmas Terme beginneth the ninth of October. if it be not Sunday and endeth the twentie and eight day of November.

Octabis Michael.	Crast. Animarum.
Quind. Michael.	Crast. Martini.
Tres Michael	Octa. Martini.
Mense Michael.	Quind. Mart.

In this Kallender following, you shall often times finde these letters B. and E. The which signifie such dayes as the Egiptians note to be dangerous to beginne or take anything in hand, as to take a iourney, or any such thing.

Ianuarie hath. 31. dayes.
The moone. 30.

Warme meates this month conuenient be,
White wine also as wholsome is:
Flie slouth, sweete drinkes, be ruled by me,
Bleede not, but bathe, forget not this.

An Instruction for the perfect vnderstanding of the manner and order of the computation, and other Tables hereafter following.

The order of this Booke, and the matters therein contained, are as followeth.

First, herein is a perfect rule to knowe the beginning and ending of the Termes, both of the Ciuill Law, and the common Law.

Then followeth a Kalender, wherein are obserued the olde saintes dayes, not of superstition, as though euery of them mentioned in the saide Kalender were a Saint, (for of some is knowne the contrary: neyther if they were all Saintes, are they therefore placed in this Kalender,) but because it hath beene a custome of auncient time to vse their names, in signifying and making certayne the dayes, times, and Tearmes of the yeare, as by the dating of diuers olde Deedes, Euidences and Records will appeare. And because the same custome is yet remayning in the returning of writtes and processes, and also is commonly vsed in the noting and setting forth of the principall fayres and markets, and all the seasons of the yeare, those names serue well for thy purpose, and therefore might not conueniently haue beene left out. And vnto the sayde Kalender are added the Calendes, Nones, and Ides, because diuers Euidences are dated on those dayes and by those wordes, and therewith also

also are added, the vigils and festiuall dayes, moreouer, the very degree and signe that the sunne is in euery day of the yeare, according vnto his middle mouing truely supputated, so that hauing this booke, there shall be no occasion to call for any other Calender.

Then beginneth the Computation of yeares, wherein is to be noted, that euery page thereof is deuided into 7. seuerall collumnes or places as may appeare by the titles ouer euery of their heades. In the first place are the yeares of our Lorde: in the second the Prime: in the third the Epact: in the fourth the Dominicall letter, and the leape yeare, whensoeuer it happeneth: in the fift are the names of the Kinges as they raigned beginning with William the Conquerour, &c. And in the same place also are the monthes that euery of them entered into their raignes. And in the sixte are the dayes of the moneths that euery of them beganne to raigne in. And in the vii. and last, are the yeares that euery of them raigned.

Also in the raigne of euery King, is shewed the day of his death, if hee died being King, or the day of his deposition, if he were deposed, with a true account how many yeares, monthes, weekes, or dayes he raigned.

And heere I thinke it meete to declare somewhat of the commoditie and necessary vse of the Computation aboue mentioned. And for the better instruction and vnderstanding thereof, I will moue certayne questions, and giue answere to the same in such sorte, as shall so better the order and manner thereof (as it were by examples) that I doubt not, but the true and necessary vse of the same, shall plainely appeare to all men.

Question.

1 Question.

I would know by this Computation, in the fourth yeare of King Edward the first, what was then the yeare of our Lord, the Prime, the Epact, Dominicall letter, and the moneth and day that he began his raigne in, and what day in the weeke the same was.

Answere.

Among the Kings, in the Computation following, seeke out for King Edward the first, and then looke for the 4. yeare of his raigne, and there it appeareth to be the yeare of the Lorde 1275. the Prime 3. the Epact 3. the Dominicall letter F. the moneth that her beganne his raigne in November, and the 16. day, which day that yeare was Saturday, as is easie to be knowne if you looke in the Kalender for the 16. day of November, accounting F. for Sunday, then that day must needes be Saturday, and so of all other the like.

2. Question.

An Evidence dated the 15. Kalends of December in the 3. yeare of King John, I would know what day of the month the same was, & how long it is since.

Answere.

First looke in the Kalender in the moneth of November for the Calends of December, and there you

you shall finde the xxv. Calendes of December is on the xvii. day of Nouember. Then seeke in the Computation for K. John, and you shall finde that the third yeere of his raigne was in the yeere of our Lorde 1201. And then set downe this yeere of our Lorde, wherein the question is asked, which is 1571. and take out thereof 1201. and there resteth 370. And so it must followe that vppon the xvii. day of Nouember next, it shall be fiftene the third yeare of King John 370. yeares, and thus of the like.

3. Question.

¶ An Euince dated the second Sunday in Lent, in the fourth yeare of King Stephen, I would knowe in what yeare of our Lorde the same was, and also in what month, and on what day the second Sunday in Lent was then.

Answere.

First looke among the Kinges for King Stephen, and when yee haue found him, then looke for the 4. yeare of his raigne, there you shall finde the yeare of our Lorde to bee 1138. and the Pzime 18. and B. the Sundayes letter. Then goe to the Table that teacheth to knowe Easter day, and all the moueable Feastes, which Table you shall finde in the 64. page.

And there vnder the Title of the Pzime, seeke among those numbers for 18. When you haue found it, looke downewarde from the line where the Pzime standeth, and seeke for the next B. which that yeare was the Sundaye letter. And when you haue found B. goe forwarde by the line and there you shall finde the 26. day of Feb. to be that

yeare

yeare the first Sunday in Lent, and thereunto put seuen dayes for one weeke more, and that shalbe that the second Sunday in Lent, that yeare, was the 27. day of Februarie. Then set downe this present yeare of our Lorde 1571. and take out therof the yeare of our Lorde that was then, which was 1138. and there resteth 433. And so it doth plainely appeare, that the 27. day of Februarie next comming, it shall be 433. yeares sith the fourth yeare of the raigne of King Stephen. And thus you may do with the like.

4. Question.

I haue a lease for lxx. yeares that began at Michaelmasse in the xvii. yeare of King Henrie the 7. my desire is to know this present yeare 1571. whether my lease be expired, or how many yeares I haue to come.

Answere.

First in the computation, looke among the Kings for King Henry the 7. and then for the 17. yeare of his raigne, which you shall finde to bein the yeare of our Lord 1501. The which number take out of this present yeare of our Lord 1571. and there rests 70. and so many yeares of the said lease shall be expired at Michaelmas next, then shall remayne x. yeares to come, and so of the like.

5. Another question and plaine example, meere for such as cannot extract one number out of another.

A lease dated the 5. of July, in the 31. yeare of the raigne of King Henry the 8. for the terme

of xl. yeeres, that beganne at our Lady day in Lent then next following: I would now knowe whether the saide lease be expired, or how many yeares there are to come.

Answere.

First looke in the Computation among the Kings for King Henry the eight, and the 31. yeare of his raigne, which you shal finde to be in the yeare of our Lord 1539. Then at the next yeare following beginne to reckon and call that one, and so tell downe in order all the yeares following, and end with this present yeare 1571. And the whole, you shall finde the number of 32. And so many yeares of the sayd lease shall be expired at our Lady day in Lent next comming. And at that time there shall remaine to come of the saide lease, viii. yeares: and thus you may account the yeares of any lease.

Another very plaine question or example, easie for all men to conceiue, and in this time is commonly vsed.

A lease dated the 17. day of August, in the v. yeare of the raigne of King Edward in 6. for the terme of xxi. yeares, which beganne at Michelmasse then next following. I aske the question this xii. day of August 1571. whether the said lease bee expired, or how many yeares are yet to come.

Answere.

First in the Computation among the Kinges seeke for King Edward the vi. and for the fift yeare of his raigne, and there you shall finde the yeare

yeare of our Lord to be 1550. Then beginne at the next yeare after, which is 1551. and call that one, & so tell downeward all the yeares, to this present yeare 1571. and in the whole you shall finde xxi. which plainely declareth, that at Michaelmas next the aforesaide terme of xxi. yeares shall be fully expired. And this you may doe in the account of all termes of yeares.

Note also, that in the sayne Computation diuerse of the Kinges haue in the first yeare of their raigne, no yeare of our Lorde. The cause is that they beganne in the same yeare that the former King dyed in. And therefore when you tell the yeares, do not recken them that haue no yeare of our Lord.

Note also that the yeare of our Lord after the Computation of the church of England beginneth euer the xxv. of March, which is the day of the Annuntiation of our Lady.

Note also, that when you account any Terme of yeares, that the same terme that your Lease first beganne in, must end & finish in the last yeare of your reckoning at the selfe same terme. And if your Lease beganne at Michaelmas, for xxi. yeares, then it must needes end at Michaelmas the same yeare that the whole xxi. yeares are expired in, and if at Midsommer, then it must ende at Midsommer the same yeare. As the last question and example dooth plainely shew.

And this I trust may suffice for the instruction of the vse, order, and commoditie of the sayde Computation.

Note that throughout this Computation following you must recken but 28. dayes to euery moneth.

A Computation of yeeres.

A Declaration of these two Tables.

By the first of these two tables may ye know the Circle of the Sunne and dominicall Let-

ter

ter orderly and perfectly for euer, any time past or any time to come, which Walter Gratons rundle could not doe. If yee list to extend it aboue 1615. in the place of 1588. set 1616. and so count orderly as yee did at the first for any yeere to come. And for any yeare past, doe thus, in the place of 1615. set 1587. and so count vpwarde till the yeere ye seeke: and in like manner doe by the Table that serues to finde the Prime and Epact, & so are they perpetuall without altering, which no rondle can performe.

Otherwise for the Circle of the Sunne and Sundayes Letter, adde to the yeere of our Lord 9. and diuide by 28. the rest shewes the Circle of the Sunne, whereto in the Tables answeres the letter Dominicall. as in this example, to the yeere 1588. I adde 9. which makes 1597. which deuided by 28 the quotient is 57. and the remaine is 1. which was the circle of the sunne for that yere, wherewith I enter the Table, and finde that G. F answereth thereto which was the Dominicall Letter for that yeere being Leape yeere, & so of the rest.

The Leape yere, as ye may perceiue by the former Table changeth euery fourth yeere: for when yee may deuide the yere of our Lord into 4. parts, then it is Leape yeere. And the Dominicall Letter is changed on the 24. of Februarie, as you may perceiue in the Almanacke by the margent.

The Golden number and Epact.

The Prime or Golden number, is a number that beginneth with one, and increaseth yeerly one, till it come to 19. and then begineth againe: it is called the Golden number, because it was sent out of Egipt to the Romanes in Letters of Gold, and thus may yee

finde

find it. To the yeare of our Lord ad 1. & deuide it by 19. the rest shewes the Golde number for that yeare, and for ease of working, ye may leaue 1500. and the one which should be added, and diuide the rest, as for example, by the yeare 1588. which is more then 1500. by 88. the which I deuide by 19. & there rests 12. which is the Prime or Golden number for this yeare that present is, and the next yeere shall bee 13. and so foorth till 19.

For the Epact.

The Epact or concurrant is thus founde: Multiplie the Prime by 11. and take away 30. and the rest is the concurrant or Epact. As for example 1588. 12. is the Golden number, which multiplied by 11. makes 132. which deuided by 30. resteth 12. the Epact for this present yeere. Or thus more easily. Yee must imagine 3. places and on the thombe most fitly, that is the roote of the thombe the first, & the middle ioynt the second, and the toope of the thombe the third, then in the first place which is the roote of the thombe put this number 10. and in the midle ioynte of the thombe 20. and at the toppe 30. this put in memorie: by the order of these places shall bee counted the Golden number. As one in the first place or roote, and two in the second or middle ioynte, and three in the third place, then so returning, set 4. on the roote or first place, 5. on the second, &c. till yee come to the Golden number for the yeere. for the which you seeke, and the number of that place must be ioyned with the Golden number of the yeare, and that that it amounts to, shall be the Epact, so that it passe not 30. but if it passe 30. let goe 30. and the remaine is your request. As in this example I will expresse it more plaine, In the yeere of our Lorde God 1588. the Prime is 12. which counted by the sayde three places of the

the thombe ends at the third, where this number 30. is placed, which both added, make 42. from which take 30. and there resteth 12. the very Epact for this present yeare, &c. And note that the Epact begynneth the first day of March, and the Dominicall letter and Prime the 1. day of Januarie.

To know the age of the Moone.

The Epact knowne, to know the age of the Moone, yee must haue three numbers. The first is the Epact, the second the number of the monthes from March (including both months) the third the dayes of that moneth passed, then ioyne these three numbers together if they rise not to 30. so old is the Moone, if they passe 30. 30. being left as often as you can, they also are the age of the Moone, this is ment by the monthes that haue 31. dayes, for in them that haue but 30. dayes the conjunction is at the 29. day, and they that passe 29. (29. being subtracted as oft as may be) are the age as before.

As for example.

This yeare 1588 for the 15. of August. I would know the age of the Moone. First the Epact is 12. and the months from March to August are 6 and 15. the day of the moneth, which all put together make 33. from whence take 30. and there resteth 3. the age of the Moone that day.

Another example.

For the 18. of September the Epact being 12. the months 7. and dates 18. added together makes 37. from thence take 29. for Sept. hath but 30. dayes, and there rests 8. the age of the Moone for that day, and in like manner shall we giue to February 29. dayes of the Moone.

And

And to know the day of the change, do thus. To the Epact adde all the monethes from March, and if they ioyned togeather come not to 30. looke what they lacke of 30. and at so many dayes of the moneth the Moone changeth. If they bee aboue 30. and the moneth of your desire haue 31. dayes, then substract 30. but if 30. dayes, then substract 29 and that rester take from 30. then looke what remaines, and at so many dayes of the moneth the Moone changeth.

As for example. In the yeare of our Lorde 1573. the Epact is 26. and Sept. from March 6. which adued together make 32. from which take 29. because September hath but 30. dayes and there rest 3. which being taken from 30. resteth 27. vpon which day the Moone changeth this yeare in September. Againe, to make it more plaine, I will prone by March that is past. The Epact is 26. which take from 30. (because March hath 31. dayes) there resteth 4. which is the day of the change. And to know the full or opposition, adde to the change day. 14. dayes 18. houres: and so for the other aspects is made this Table that followeth.

				D. H.
To the coniunction	✱	to the full	△	14. 22
	□		□	7. 9
	△		✱	9. 20

Note for certaine that the first Tuesday euery yeare after the change of the Moone in February is Shrouetuesday, which being knowne you may easilie finde vpon what day of the moneth all other mooueable feasts throughout the yeare doe fall vpon for euer.

A table to know how long the Moone shineth, and when she riseth and setteth.

The age of the Moone increasing.	The houres the Moone shineth.		her age decreasing.
☽	H.	M	☾
1	0.	48	29
2	1.	36	28
3	2.	24	27
4	3.	12	26
5	4.	0	25
6	4.	48	24
7	5.	36	23
8	6.	24	22
9	7.	12	21
10	8.	0	20
11	8.	48	19
12	9.	36	18
13	10.	24	17
14	11.	12	16
15	12.	0	15

The vse of this Table is thus, the age of the Moone once knowne and found in the side of the Table, then answering thereunto, shall ye set the houres and minutes of her shining to be counted from the Sunne setting, all the encreasing till the full, and till then she shineth in the euening, & after the full she shineth before the sun doth rise in the morning so many houres before the sunne riseth, as the Table sheweth. And for her rising and setting, do thus: all the encrease adde to the houres of the Sunne rising, the houres found in the Table, and it sheweth the houre of her rising. Againe, adde to the houre of the sunne setting, the houre and minutes found in the Table, and that is the houre of her setting. Then after the full, for her rising do thus: From the Sunne rising, take the houres found in the table, and the rest sheweth the rising, and from the houre of the Sunne setting, take the houres found in the Table, borrowing 12. if the Substraction cannot else be made, and the rest sheweth the setting of the Moone.

All

All these aforesaid, by example shall be made manifest.

The 30. day of September 1588. I finde the Moone to be 21. dayes olde, wherewith I enter the Table, the moone decreasing, & finde seuen houres two minutes aunswering thereto: so I say the Moone shines 7. houres 2. min. in the morning before the sunne rise, and the sunne the same day riseth at 6. and 12. minutes, whereto I put 12. houres as could not the substraction be made, and it makes 18. houres 12. minutes from which I take 7. houres 2. minutes, and there rests 11. houres 10. minuts before midnight, at which instant the Moone ariseth.

Another Example.

The 20. day of October 1588. the moone is 10. dayes olde, wherewith I enter the Table, the moone increasing, and finde 8. houres answering thereto, which shewes that the Moone shines eight houres in the euening after the Sunne is set, and the sunne the same day sets at 5. of the clocke 15. minuts, whereto I put 8. the houre of the Table, & it makes 13. houres 15. minutes, from which I take 12. which is midnight, and there resteth 1. houre 15. minuts, which sheweth that the Moone shall set the same day at 1. a clock 15. minuts, after midnight. Likewise the same day the sunne riseth at 6. of the clock 41. minutes, to which I adde 8. and it makes 14. houres, 41. minuts, from it I take 12. (for that is noone) and there rests two houres 41. minuts, which sheweth that at 2. of the clocke 41. minuts after noone, the Moone ryseth, though to vs vnseene, and so for all other times.

A Table to know the houres of the night by the shadow of the Moone in any Sunne Diall.

☽	H. M.	☾
1		29
2	10.24	28
3	9. 36	27
4	8. 48	26
5	8. 0	25
6	7. 12	24
7	6. 24	23
8	5. 36	22
9	4. 48	21
10	4. 0	20
11	3. 12	19
12	2. 24	18
13	1. 36	17
14	0. 48	16
15	0.	15

First know the age of the Moone, then having a sun Diall, see where the Moone giueth shadow, and from the same take the houre & minute answering to the same, if the Moone increase, and the rest sheweth the houre after midnight: but after the full, al the wane adde the same, and that shewes your desire.

Example.

The Moone being 10. daies old, and in the Diall she pointeth by the shadowe the fifth houre, from that I take foure which answereth to ten because she increaseth, and so resteth one, which shewes that it is one of the clocke at midnight. Againe, shee being 21. daies old, pointeth in the Dial the 11. houre, thereto I adde 4. houres and 48. minutes, and it makes 15. houres and 48. minutes, thence I take 12. and there resteth 3. houres and 48. minutes, the true houre of the night.

Article

A rule to knowe the houre of the day, either afore noone or after noone, by the beames of the Sunne, and the length of the Ruler, as followeth,

First, ye muſt haue a rule of three or ſix inches long, which muſt bee deuided into twelue partes, as in the figure following, (which ſo prepared) when yee ſhall know the houre of the day, ſet your rule or ſtaffe vpright vpon a plaine leuell bourd or ground, and take the iuſt length of the ſhadowe, what partes of the rule it containeth, wherewith enter the Table following, and againſt the degree of the Sunne that day, ſeeke the length of the ſhadowe, and in the head of the Table, yee ſhall ſee the houre of the day, either in the forenoone or afternoone, as your deſcription ſhall diſcerne, for that the Sunne hath like altitude at like diſtance from the Meridian line in the forenoone aſcending, and in the afternoone deſcending, if yee finde not the iuſt length, take the greater number next to it in the forenoone, and in the afternoone take the leſſer next vnto, and each ſhall giue you the houre paſt, as in the example.

The 23. of Nouember, when the Sunne is in the 10. of Sagittarie, I would know what houre it is by the Sunne. I ſet vp the diuided Rule, and the length of the ſhadowe is 57. partes long, that is 4. times the length of the Rule, and 9. partes more, which ſhewes that it is ten of the clocke in the forenoone, or two of the clocke afternoone, which is eaſily diſcerned.

Another.

The 5. of December, the Sunne being in the 23. degree of Sagittarie, I finde the shadow to be 52. parts, that is, foure times the rule, and foure vnder, which sought in the table against the 20. degree of Sagittarie, for it is nerest (for so must yee alwayes do when the number precisely is not precisely found) and find 50. but the nerest lesse is 47. the nert about is 62. the difference is 15. then take 47. from 52. and there rests 4. then say by the rule of proportion, if 15. giue 60. (for so many minutes be in one houre) what shall 4. giue, multiply the second by the third, that is 60. by 4. and the product of them, will be 240. which shewes, that it is either 16. minutes before 11. in the forenoone, or 16. minutes after 1. of the clocke in the afternoone, and so of all other, which in mine opinion is the most precise Horologie that may be: though at the first it seeme somewhat harue? The Table followeth.

A Table

the foresayde Table as followeth.

FIrst note, that the saide Table is deuided into fiue columnes or places. In the first is the Prime, in the second the Dominicall letter, in the third, the first Sunday in Lent, in the fourth, Easter day, in the fift, Rogation weeke, and in the sixt Whitsunday.

And for the better vnderstanding of the vse thereof, yee must alwayes when ye desire to know the time of any of the sayde Feastes, first consider what yeare of our Lorde it is that yee woulde knowe them in, and then looke the Prime of that yeare, and the Dominicall letter, and those you may easily finde and learne in the title of the Table for that purpose, that is before set foorth. And when yee know the Prime and Sundaies Letter, then come to this Table, and it will easily shewe you your desire.

Example.

I would knowe in the yeare of our Lorde 1588. when shall be the first Sunday in Lent. Easter day &c. First I goe to the Table aforesayde, and there in the first columne, I seeke out the yeare of our Lord 1588. and in the second columne directly against that, there I finde that yeare, the Prime to be twelue, and vnder that, the Dominicall letter to bee G. F. Then I come to the aboue sayde Table, and first vnder the Title of the Prime, I seeke for the number of 12. and when I haue found the same, then I looke downwarde among the Sundayes letters for the next F. that is after the Prime, for that is the Sundaies Letter for

for that yeare: and when I haue found F. I go forwarde in that line where F. standeth, and first I finde that the 24. day of Februarie that yeare, shall be the first Sunday in Lent. The 7. day of Aprill Easter day. The 12. day of May, Rogation Sunday, and the 26. day of May, Whitsunday. And thus may you do with all other, both for time past, and time to come for euer.

Note also that this table in the beginning, sheweth the lowest Month and day in the yeare that Easter and all other moueable feasts do fall on, and in the end, it sheweth the highest Month and day, that Easter, and the moueable feasts do ascend vnto: so may it be truly said, that it is a perfect table.

And yet hereunto will I adde one Rule, which although it be in olde and rude meeter, yet it is worthy of memorie, and it is the same rule whereby this Table was made, which is thus.

In March after the first C.
Looke the prime where euer it be,
The third Sunday after Easter day shalbe
And if the prime on the Sunday be,
Then reckon that for one of the three.

A rule to know certainely the *Dogge dayes.*

The Dogge dayes doe alwayes beginne the sixt of July, and end the 17. of August.

A yeere hath { By the course of the sunne xii. moneths.
By the course of the Moone xiii. moneths.
Of weekes, fiftie and two, that is, 365. dayes, except it be Leape yeere, and then it hath 366. dayes.

A rule to know all the Vigils and fasting dayes throughout the whole yeere.

With moueable feasts I will beginne,
As Easter, Ascention, and Whitson euen.
The Rogation weeke in like case,
Must be kept as it commeth in place.
And the Apostles, as Peter and Paul,
Iames, Mathy, with other moe,
Andrew, Mathew, and the rest as they fall,
Bartholemew, Thomas, Iohn Baptist also.
Simon and Iude, and the Purification,
The birth of Christ, and the Annunciation,
Ember, Fridayes, and Lent as it doth come,
The euen of all Saints, and so we haue done.

A rule to know how many dayes euery moneth in the yeere hath.

Thirtie dayes hath November,
April, Iune, and September,
Februarie hath xxviii. alone,
and all the rest hath thirtie and one.

Exception.

But when of Leape yeare commeth the time,
Then dayes hath Februarie twentie and nine.

A Table for the Tides.

N. W.		N.w by N.				N. N.W.		N. by W.

IF you desire at any time to know when it is full sea, or high water at any Port or Haven in England, Wales or Ireland, or in any other part of the world. If first by your owne knowledge, or the knowledge of any expert Mariner, you know when you see the Moone in such part of the firmament, that then it is full sea at such a port or haven, then these Tables shall be needelesse for you. But if you cannot so do, and would learne, then resort to these Tables, and first consider with your selfe, how many dayes olde the Moone is the day that you desire to know the tide.

And in the middle of the said Tables, you shall finde in the vppermost part of them this Title The age of the Moone, and right against the day of the age of the Moone you shall finde on both sides, the places and pointes of the firmament, as South, South and by West, and South Southwest, &c. And next vnder the line are these letters H. M. which signifies houres and minutes. Then hauing in memorie the age of the Moone as aforesaide, goe directly to the Title of that place of the Firmament, to which when the Moone commeth, maketh a high water, and there you shall finde the houre and minute when it is full sea in that place.

Example.

I would know at what houre it will be a full sea, or high water at London bridge, the 12. day of December next, being in the yeere of our Lorde 1588.

Answere

For Ebbes and Flouds.

Answere.

First resort yee to the former Table that teacheth you to know the age of the Moone at all times, and by that rule you shall finde, that the 11. day of December next, the Moone shall be 4. dayes older then looke vpon the titles in the vppermost part of the aforesaid tables, and among them you shall finde London.

And directly in the next vnder the same, you shall finde Southwest, the which declareth, that when the Moone is in the Southwest, that then it is full sea at London bridge. Then goe downe the line of the age of the moone vntill you come at the 4. day, and there you shall finde at the left hand of the same, directly vnder the line where southwest standeth, these figures 6. 12. which is six of the clocke and 12. minutes, at which time the aforesaid 12. day of December next, shall be high water at London bridge.

And in the vppermost part of the aforesaide table I haue written the names of some ports, at which time the Moone comming to the place causeth a full sea, and vnto them yee may adde such other as you haue or shall haue knowledge of.

A rule to know by heart what part of mans body is subiect to any of the 12 signes.

The head and face doth Aries rule,
as Taurus doth the necke:
But armes and hands in Geminies power
doth suffer ioy or wrecke.
Cancer doth guide the breſt, the lunges,
the ribs and stomacke stout,
Leo likewiſe hath hart and backe,
there of yee needs not doubt.
The belly and bowels Virgo hath,
and eke the entrals all.
The loynes, the kidneies and the reignes,
to Libras lot doth fall.
The bladder and the secret partes,
to Scorpio are the fees.
The thighs doth Sagittary guide,
and Capricorne the knees.
The legs to Aquary belong,
to vſe them as he luſt.
But Piſces holdes the feete and heeles,
and ſo for euer muſt.

A Table shewing what signe the Moone is in, and shall be for euer and also what part of mans body euery signe doth gouerne, with the infirmities incident thereto.

A declaration of the table that is on the other side, shewing at all times what signe the moone is in.

First, for the better vnderstanding thereof, note that this Table is diuided into fiue titles, that is to say, into moneths, dayes, prime, signes, and gouernment of the signes. Nowe if yee will knowe at any time what signe the moone is in, you must first seeke out the saide Table among the moneths, for the month where in you desire to bee certified, and likewise among the title of the dayes, for the day of the month that yee desire. And when yee haue found them, then beginne at the moneth and tell the same for one day, and so goe forth vntill you come to the number of the dayes that yee woulde haue, and note well what daye the same doth ende vpon, and keepe it in your memorie. Then seeke for the Prime of that yeere among the title of Primes, and accounting the prime for one, tell so many dayes before you committed to memorie: & then on the right hand yee shall finde what signe the Moone is in, and what member of mans bodie it gouerneth, with the infirmities thereto pertaining.

Example.

I woulde knowe the eight day of December next, in the present yeere of our Lorde 1588. what signe the Moone will bee in. First I looke in the aforesaide Table, and among the title of the moneths, and there I finde December, placed against the figure 4. which is the title of dayes, and there I beginne to reckon, and call that figure

figure of 4. one, and so tell vpwarde vntill I come to 8. and I finde that the same endeth vpon 11. which number I keepe in memorie. Then I seeke for the Prime of this yeere, which is 12. among the title of Primes, and on the left side thereof standeth 11. and there I beginne againe and call that 11. one and 10. go downewarde, till I come to the number which I had kept in memory, which was 11. and on the right side thereof, I finde the signe to bee Capricorne, which gouernes the knees, with his infirmities, Itching, red spots, leprosie.

A perfect, easie, and ready rule to know in what signe the Moone is in euery day.

When ye know the age of the Moone, double the same, and then diuide it by 5. and the quotient shall shew you how many signes ye shall adde to the signe that the conjunction was in, and the remaine euery vnite thereof giueth 6. degrees, which ye muste adde to the degree of the sunne, the day of ♂ if they passe 30. adde one signe, and the rest will shewe the degree of the signe in very neare: but of the signe it will neuer faile for suretie.

Example.

This present 18. of October, the Moone is 22. which doubled is 46. and deuided by 5. the quotient is 9. and 1. rest 1. that is 9. signes and 6. degrees, which I adde to the signe and degree of the conjunction (that is Virgo the 12. and it is ♍. 17.) and so of all others.

the course of the Moone, in any signe of the Zodiake. And first of blood letting.

LEt blood at no time without great cause, for it weaketh and maketh way to many diseases, but if yee doe, see it be after good digestion and fasting, in any temperate day, and afterwards vse fine meates of light digestion, abstaining from all exercise, as bathing, watching, and carnall copulation. Next consider the time of the yeere: if it be in the spring, let blood at the right fine and in the harueſt at the left. Thirdly the age of the person: for young persons, from the change to the first quarter, for them of middle age, from the first quarter to the full, and for elder persons, from the full to the last quarter, and for olde folke, from the last quarter to the change. Fourthly, consider the parties complexion. If it be chollericke, then let the moone be in ♌ in the last halfe of ♓. If it be flegmaticke, in ♈. or ♐. If he be melancholy, the first part, of ♒. But if he be sanguine, let the moone be in any of the aforesaid signes, only beware you let not blood in any member when the moone is in the signe that ruleth the same, neither the day of the change, nor the day before, nor the day after, for that were perillous.

The best times to purge, if that time be temperat { by drinks / by electu. / by pilles. } Luna in { Scor. / Can. / Pisc. }

To enter bathes for hot diseases. Scorp. Can. Pisc.
For cold diseases, Aries. Leo. Sagit.
To stop flures, Remmes & Iares. Taur. Vir. Capri.
To take preparatiues, Aries. Leo. Sagit.
To take vomite, Leo. Aries. Capri.
To take gargarises, Aries. Cancer. Capri.
To take Glisters Libra, Scorpio.

Good to comfort the vertue. { Attractiue. Retentiue. Digestiue. Expulsiue } the Moone in { ♈ ♌ ♐ ♉ ♍ ♑ ♊ ♎ ♒ ♋ ♏ ♓ }

To cut haires that they may grow better, Taurus Virgo, Libra, and Luna increasing.

To geldе or lib Cattell, Sagita. Capri. Pisces. and Luna decreasing.

Good to sow or set, Taurus. Cancer. Virgo. Libra. Capri. and Luna decreasing.

To graffe or plant, Taurus, Aquarius, and Luna increasing.

To cut Vines, Aries, Scorpio, Libra, and Luna increasing.

To fell wood for Timber, from saint Barnabas day in June, till the 1. Calend. of January, in the wane of the Moone.

To fell fire woode that the stocke may soone spring from the change to the first quarter.

To remoue grafts or young Trees, at the last quarter of the Moone.

These two tables following, shall perfectly shewe you the breake of the day, Sunne rising, length of the day and night artificiall, the setting of the Sunne, and twilight for the whole yeere, whereby yee may know the planetary houre, and what Planet doth raigne any day or houre for euermore vse is thus.

In the first colome looke for the moneth wherein yee are descending or ascending, then in the next colome thereto, finding out the day, or the next thereto, and right there against towarde the right hand if yee descende, yee shall finde the houre and minute of any of the aforesayde in the collome vnder the title thereof, but if ye ascend by the right side of the Table, then looke towarde the left, and doe as before, the worke is easie, it needes no example at all: but because I promised to make it as playne as might bee, I will shewe an example sufficient, and that is thus: The 22. day of September, I would know all that is aforesayd. I enter the Table descending by September, and finding the 22. day against the same in the collome vnder the title, breake of the day, I finde 4.20. which shewes there at 4. of the clocke 20. minutes is the breake of the day. In the next 6.18. which shewes the sunne rising, in the third collome 11. houres 24. minutes, the length of the day, and 12.36. in the fourth, the length of the night 5.42. the setting of the sunne, and 7.40. the twilight, or the going downe of the day light, and so of all other dayes.

The vse of this Table is thus.

VNder the day of your request, seeke the houre that ye desire, then on the left side right there against shall ye see the planet that gouerns that houre by day, and at the right side the Planet that rules it by night, as thus. On Thursday the third houre of the day rules ☉. and the 8. houre of the night gouernes ☽, and so of the rest, for it is plaine enough.

A Table to know the length of the planetary houre, from the shortest day and longest night, till the longest day and shortest night, of what length soeuer the day or night be.

The vse of this Table.

KNow the length of the day or night that ye require by the Table proceeding in houres and minutes, & therewith enter this Table the houre at the side, and the neerest minute at the head, and then descend right against your houre, and there in the common angle, ye shall finde the houre and minut, or minuts, onely that the Planet raigneth by the houres of the clockes.

As for example.

The 21. of June, the day is 16. houres, 20. minutes, wherewith I enter this table as ye shewed, and

and in the angle I finde 1. houre, 22. minuts, which sheweth that a Planet that daye rules an houre and a quarter and 7. minuts of the clocks. Also for the same night I finde it to be but 7. houres and 40. minutes, wherewith I enter this table with 7. at the side and 36. at the head (for that is the nearest) so in the common angle I finde but onely 38. minutes which shewe that a Planet in that night, rules but halfe an houre and 8. minutes of the clockes, and so of the rest.

A declaration of this Figure following.

But for more ease in account I haue deuised this figure following, which presently shall shewe you the houre of the Planet by day or night at all times. The vttermost margent whereof, is deuided in 24. partes, representing the 24. houres of the Equinoctial or clockes, which euer are of 60. minutes, and euery houre is deuided into foure partes, within the same haue you the houres artificiall, or houres of the Planets, as well for the night as for the day, the Orizon line diuiding the same, which for the better knowledge is bedecked with shadowes, and all that is aboue the same is counted day because when the sunne comes vpon the line in the East, it is day, for then beginnes the day artificiall: And when the Sunne comes to the same in the West, he departes from our sight, and then beginnes the artificiall night. So likewise all vnder the same is nyght, and therefore printed blacke in the center, wherein must bee put a threede with a knot, or a small Beade to bee remooued at pleasure.

The

The vse thereof is thus.

Know that the Table for that purpose, the rising of the sunne for the day ye desire, and vpon the same houre and neerest quarter, in the vttermost margent lay the threed, remooving vp and downe the knot or beade, till it lie vpon the orizon line, there holde it stedfast at the centre ende, and remoove your other hand vnto the houre of the clocke, called the houre of the day, either before noone or after, then the knot among the planets houres, shall shewe the iust houre of the artificiall day, expresse the figures of Arithmetik, wherewith enter the Table of the Planetes, with the

day

day at the head, and so the number of the houre shall shewe you at the left syde, the Planet that rules by day at the right syde, the planet that rules the same houre by night.

Example.

The xx. of October beeing Tuesday, I would know what Planet raygnes at 3. of the cloche 30. minutes after noone. By the table of the sunne rysing, I finde that the xx. day of October the sunne riseth at 7. of the cloche 15. minutes, which found in the figure, I put the threed thereto, and set the knot on the ozizon, then remoone I the threed to 3. of the cloche 30. min. after noone in the margent, and the knot shewes the xi. houre of the artificiall day wherewith I enter the table of planets vnder Tuesday, and right against xi at the left syde is ♀, which rules that present houre.

Againe at x. of the cloch at nyght, I would do the like, I remoone the threede to x. in the margent, and the knot amongst the houres of the night, shewes the fift houre of the artificiall night, wherewith I enter the table as before, and finde right against 5. at the right syde ☽. which rules that present houre. &c.

This doone if you desire to know how long the planet of that houre hath ruled, or how long he shall rule, doe thus: set the threede to the time that ye desire to know the planets houre, and if the knot lighe vppon the time that diuides the artyficiall houres, then, and at that instant beginnes the planetarye houre: but if the knot fall within the space, remoone your knot to the line preceeding, then shall the threede in the margent shewe at what time the Planet begaune to raygne, then remoone the knot to the line following, and the threede in the margent will shewe you the instant of the cloche when the planet shall cease to rule.

whereof take this example.

Sunday the xxviii. day of March the Sunne ryseth at 5. of the clocke, 3. minutes, and at 15 minutes past 9. of the clocke I finde by the aforesayde rules of the Moone to raigne at that instant, because the knot falles in the midst betweene the lines, then set I the knot backe to the line, and the threede sits vpon 30. min. after 8. then began Luna to raigne. Then remoue I the knot to the line following, and the threed doth marke in the margent 45 minutes past 9. of the clocke, and then doth the Moone ende her dominion for that time, till her course returne, then take 8.30. out of 9.45. and there rests 1. 15. and so long raigned a Planet at that time.

The properties and effects of the Planets.

Judoth

SAturne is an enimy to humane nature, a destroyer of life, maleuolent cold, dry earthly, musculine, of the day, the greater fortune of mans body, he rules the right eare, the spleane, the blather, and the bones, of humors melancholy mixt with fleame, of persons old men, husbandmen, miners masons, Tanners, Jewes Enuious persons, stuborne, solitary, stil leane, berdlesse, couetous, gluttons, deceiuers Husbandry fruits of the earth, mines of mettalls, treasures buildings, herritage of the dead, possessions, prison, and hath of colours blacke. The greatnesse of his body is 91. times so big as the earth, the quantity of his beames are 9. degrees forward and backward. He makes his

reuolution

reuolution or passeth thorow the Zodiacke in 30. yeares. His fewest yeares are 30. his meane 43. his greater 57. & his greatest are 465. yeares he is expressed in likenesse of an old man leaning on a staffe or holding a fish in his hand, thus ♃.

Iupiter is the greater fortune of the day, hotte and moyst, benenolent. He rules in mans body, the liuer, lights and lungs, the ribs, the arteries, the blood, the seed, vaines, and the left eare. Of humours, the sanguine. He signifieth bishops, prelates, lawyers, iudges, shamefast, gentle and humble, iust, honest, true, faithfull, liberall, vertuous and religious gouernours of cities, & rich men, ecclesiastical dignities, religion iustice, honesty, prayse. Of colours blewe, or citrine. The greatnesse of his body is 95. times so much as the earth: the quantitie of his beames are nine degrees, he endes his course in 12 yeares almost: his fewest yeares are 12. his meane yeares are 45. and a halfe, his greater yeares are 79. and his greatest yeares of all are 428. And to shewe forth his threefolde thunderbolts, hee is expressed with three draughts thus ♃. which is not much vnlike a mace or scepter of honor, as some very fitly haue imagined.

Mars is the lesser infortunate, masculine, of the night, immoderately hotte and dry. Of mans body he gouernes the gal, the veynes, sinewes, stones and the left eare: of humors the cholericke: and of colours reddy. He signifieth of persons, the warriors, seditious, disdainefull, coniurers, or conspirers, irefull theeues, cruell, bold, irreuerent, murtherers, raptaines, chirurgians, Turks, terrible, violent, carelesse, workers in fire workes, gunners, and founders, warre, strife, dissention, tyranny violence, armory, Alcumy, and all things wrought and done by the fire. The greatnesse of his body, is once as bigge as the earth, and halfe so

bs. She rules the left eie of a man, and the right eye of a woman, and of booth, the stomacke, the taste, the liuer the belly, and the left side. She signifieth noble women, widdowes, the vulgar sort, and those of continuall motion, as Mariners, Messengers, Legats, and vagabonds. Also all things that abound in moysture, the sea, riuers, with their ebs and floods, the studies of histories, Embassages, Nauigation, iourneying, seruice, planting, sowing, and all water workes. Of humours the fleame, of colours, white or siluer colour. The greatnes of her body, is $\frac{1}{39}$ part of the earth. The quantity of her beames are 12. degrees: she makes her passage through the Zodiacke in 27. dayes, and 8 houres, and ouertakes the Sunne in 29. dayes, 12. houres, or there about. Her lewest yeares are 25. her meane yeeres are 66. and a halfe, her greater yeares are 108. and her greatest yeares are 520. and because she is commonly seene horned, or halfe round, she is figured thus ☾.

The Dragons heade, (which is the intersection made by the cutting or crossing lines of the Nodes of the Sunne or moone) is good with the good, and badde with the badde, for if it be ioyned with good Planets, it augmenteth their goodnesse, and ioyned with the euill, it dooth increase the malice and euill nature of them, and is figured thus ☊.

The Dragons tayle, which as it is the opposite point to the heade, so it is contrary in nature, for with the good it is bad, and with the bad it is good, for with whomesoeuer it is ioyned it dooth diminish the operation of them, be it good or badde, and is expressed thus ☋

The

Vniuersitie Colledge, founded by Alured, king of the Saxons, in the yeare of our Lord 872. Vniuersity colledge.

2 Bayly colledge, founded by Iohn Balliol, king of the Scots, in the yeare of our Lord 1263. Balliol colledge.

3 Martin colledge, founded by Walter Martin, bishoppe of Rochester, in the yeare of our Lorde 1276. Martin colledge.

4 Exceter colledge and Hart hall, founded by Walter Staple ine Bishop of Exceter, 1316. And the sayde Colledge was much increased by sir William Peter, late Secretarye to King Henry the eight 1566. Exceter colledge. Harts hal.

5 Oriall colledge, founded by Adam Browne, brought vppe in the Vniuersity of Oxford, by King Edward the second, in the yeare of our Lorde God, 132[illegible]. Oriall colledge

6 Queenes colledge, founded by Robert Eglisfield, Chaplaine to Philip King Edward the thirds wife 1349. Queenes colledge.

7 New colledge, founded by William Wickham Bishop of Winchester, in the yeare of our Lord 1375. New colledge.

8 Lincolne colledge, founded by Richard Fleming, Bishop of Lincolne. And increased by Thomas Rotheram Bishop of the same See, in the yeare of our Lord 1420. Lincolne colledge.

9 All Soule colledge, founded by Henry Chechelley Archbishop of Canterbury in the yeere of our Lord 1437. All Soules colledge.

10 Magdalen colledge, founded by William Wainfleet Bishop of Winchester, and Chancel- Magdalen colledge.

These two tables following, shall perfectly shewe you the breake of the day, sunne rising, length of the day and night artificiall, the setting of the Sunne, and twilight for the whole yeere, whereby yee may know the planetary houre, and what Planet doth raigne any day or houre for euer: the vse is thus.

In the first colome looke for the moneth wherein yee are descending or ascending, then in the next colome thereto, finding out the day, or the nert thereto, and right there against towarde the right hand if yee descende, yee shall finde the houre and minute of any of the aforesayde in the collome vnder the title thereof, but if ye ascend by the right side of the Table, then looke towarde the left, and doe as before, the worke is easie, it needes no example at all: but because I promised to make it as playne as might bee, I will shewe an example sufficient, and that is thus: The 22. day of September, I would know all that is aforesayd. I enter the Table descending by September, and finding the 22. day against the same in the collome vnder the title, breake of the day, I finde 4.20. which shewes there at 4. of the clocke 20. minutes is the breake of the day. In the next 6.18. which shewes the sunne rising, in the third collome 11. houres 24. minutes, the length of the day, and 12.36. in the fourth, the length of the night 5.42. the setting of the sunne, and 7.40. the twilight, or the going downe of the day light, and so of all other dayes.

A table to know what Planet rules euery houre either of day or night for euer.

Gouernours of the day.	Sunday.	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saterday.	Rules of the night.
Sol.	1	12	9	0	10	0	11	Iupiter.
Venus.	2	0	10	0	11	1	2	Mars.
Mercury.	3	0	11	1	12	2	0	Sol.
Luna.	4	1	12	2	0	3	0	Venus.
Saturne.	5	2	0	3	0	4	1	Mercury.
Iupiter.	6	3	0	4	1	5	2	Luna.
Mars.	7	4	1	5	2	6	3	Saturne.
Sol.	8	5	2	6	3	7	4	Iupiter.
Venus.	9	6	3	7	4	8	5	Mars.
Mercury.	10	7	4	8	5	9	6	Sol.
Luna.	11	8	5	9	6	10	7	Venus.
Saturne.	12	9	6	10	7	11	8	Mercury.
Iupiter.	0	10	7	11	8	12	9	Luna.
Mars.	0	11	8	12	9	0	10	Saturne.

The vse of this Table is thus.

VNder the day of your request, seeke the houre that ye desire, then on the left side right there against shall ye see the planet that gouerns that houre by day, and at the right side the Planet that rules it by night, as thus. On Thursday the third houre of the day rules ☉, and the 8. houre of the night gouernes ☽, and so of the rest, for it is plaine enough.

A Table to know the length of the planetary houre, from the shortest day and longest night, till the longest day and shortest night, of what length soeuer the day or night be.

17	1. 20	1. 26	1. 20	1. 28	1. 20

The vse of this Table.

KNow the length of the day or night that yee require by the Table proceeding in houres and minuts, & therewith enter this Table the houre at the side, and the neerest minute at the head, and then descend right against your houre, and there in the common angle, yee shall finde the houre and minut, or minuts, onely that the Planet raigneth by the houres of the clockes.

As for example.

The 21. of June, the day is 16. houres, 20. minutes, wherewith I enter this table as is shewed, and

and in the angle I finde 1. houre, 22. minuts, which sheweth that a Planet that haue rules an houre and a quarter and 7. minuts of the clocke. Also for the same night I finde it to be but 7. houres and 40. minutes, wherewith I enter this table with 7. at the side and 36. at the head (for that is the nearest) so in the common angle I finde but onely 38. minutes which sheweth that a Planet in that night, rules but halfe an houre and 8. minutes of the clockes, and so of the rest.

A declaration of this Figure following.

BVt for more ease in account I haue deuised this figure following, which presently shall shewe you the houre of the Planet by day or night at all times. The vttermost margent whereof, is deuided in 24. partes, representing the 24. houres of the Equinoctial or clockes, which euer are of 60. minutes, and euery houre is deuided into foure partes, within the same haue you the houres artificiall, or houres of the Planets, as well for the night as for the day, the Vrizon line dividing the same, which for the better knowledge is bedecked with shadowes, and all that is aboue the same is counted day because when the Sunne comes vpon the line in the East, it is day, for then begynnes the day artificiall: And when the Sunne comes to the same in the West, he departes from our sight, and then begynnes the artificiall night. Solikewise all vnder the same is nyght, and therefore printed blacke in the center, wherein must bee put a threede with a knot, or a small Beade to bee remooued at pleasure.

The

The vse thereof is thus.

Know that the Table for that purpose, the rising of the sunne for the day ye desire, and upon the same houre and nerrest quarter, in the vttermost margent lay the thred, removing vp and downe the knot or beade, till it lie vpon the orizon line, there holde it stedfast at the centre end, and remoove your other hand vnto the houre of the clocke, called the houre of the day, either before noone or after, then the knot among the planets houres, shall shewe the iust houre of the artificiall day, expresse the figures of Arithmetik, wherewith enter the Table of the Planetes, with the

day

ay at the head, and so the number of the houre shall
etwe you at the left syde, the Planet that rules by
y at the right syde, the planet that rules the same
ure by night.

Example.

Therr. of October beeing Tuesday, I would
ow what Planet raygnes at 3. of the clocke 30.
inutes after noone. By the table of the sunne ry-
ng, I finde that the rr. day of October the sunne
eth at 7. of the clocke 15. minutes, which found in
e figure, I put the threed thereto, and set the knot
the ortzon, then remoone I the threed to 3. of the
ocke 30. min. after noone in the margent, and the
ot shewes the rr. houre of the artificiall day where-
ith I enter the table of planetes under Tuesday,
d right against rr at the left syde is ♀. which rules
t present houre.

Againe at r. of the clock at nyght, I would do the
e, I remoove the threede to r. in the margent, and
e knot amongst the houres of the night, shewes the
t houre of the artificiall night, wherewith I en-
r the table as before, and finde right against 5. at
e right syde ☽. which rules that present houre. &c.

This doone if you desire to know how long the
anet of that houre hath ruled, or how long he
all rule, doe thus: set the threede to the time
at ye desire to know the planets houre, and if the
ot light vppon the time that diuides the arty-
iall houres, then, and at that instant beginnes
e planetarye houre: but if the knot fall within
e space, remoone your knot to the line nexte-
ng, then shall the threede in the margent shewe at
at time the Planet beganne to raygne, then
noone the knot to the line following, and the
eede in the margent will shewe you the instant
the clocke when the planet shall cease to rule,

whereof take this example.

Sunday the xxviii. day of March the Sunne ryseth at 5. of the clocke, 3. minutes, and at 15 minutes past 9. of the clocke I finde by the aforesaide rules of the Moone to raigne at that instant, because the knot falles in the midst betweene the lines, then set I the knot backe to the line, and the threede sits vpon 30. min. after 8. then began Luna to raigne. Then remoue I the knot to the line following, and the threed doth marke in the margent 45 minutes past 9. of the clocke, and then doth the Moone ende her dominion for that time, till her course returne, then take 8. 30. out of 9. 45. and there rests 1. 15. and so long raigned a Planet at that time.

The properties and effects of the Planets.

Judoth

Saturne is an enimy to humane nature, a destroyer of life, maleuolent cold, dry earthly, musculine, of the day, the greater fortune of mans body, he rules the right eare, the spleane, the blather, and the bones, of humors melancholy mixt with fleame, of persons old men, husbandmen, miners masons, Tanners, Jewes Enuious persons, stuborne, solitary, stil leane, berdlesse, couetous, gluttons, deceiuers Husbandry fruits of the earth, mines of mettalls, treasures buildings, herritage of the dead, possessions, prison, and hath of colours blacke. The greatnesse of his body is 91. times so big as the earth, the quantity of his beames are 9. degrees forward and backward. He makes his

reuolution

reuolution or passeth thorow the Zodiacke in 30. yeares. His lewest yeares are 30. his myane 43. his greater 57. & his greatest are 465. yeares he is expressed in likenesse of an old man leaning on a staffe or holding a fish in his hand, thus ♃.

Iupiter is the greater fortune of the day, hotte and moyst, benenolent. He rules in mans body, the liuer, lights and lungs, the ribs, the arteries, the blood, the seed, pulses, and the left eare Of humours, the sanguine. He signifieth bishops, prelates, lawyers, iudges, shamefast, gentle and humble, iust, honest, true, faithful, liberall, vertuous and religious gouernours of cities, & rich men, ecclesiastical dignities, religion iustice, honesty, prayse. Of colours blewe, or citrine. The greatnesse of his body is 95. times so much as the earth: the quantitie of his bearnes are nine degrees, he endes his course in 12. yeares almost: his lewest yeares are 12. his meane yeares are 45. and a halfe, his greater yeares are 79. and his greatest yeares of all are 428. And to shewe forth his threefolde thunderbolts, hee is expressed with three draughts thus ♃ which is not much vnlike a mace or scepter of honor, as some very fitly haue imagined.

Mars is the lesser infortunate, masculine, of the night, immoderately hotte and drye. Of mans body he gouerns the gal, the veynes sinewes, stones and the left eare: of humors the cholericke: and of colours reddie. He signifieth of persons, the warriors, seditious, disdainefull, coniurers, or conspiters, irefull theeues, cruell, bold, irreuerent, murtherers, captaines, chirurgians, Turkes, terrible, violent, carelesse, workers in fire workes, gunners, and founders, warre, strife, dissention, tyranny violence, armory, Alcumy, and all things wrought and done by the fire. The greatnesse of his body, is once as bigge as the earth, and halfe so

bigge againe, and one eight part of the same. The quantitye of his beames are 8. degrees. Hee ends his course in 2. yeeres almost, his fewest yeeres are 15. his meane yeeres 40. and a halfe: his greater yeares are 66. and his greatest yeares are 264. and because he is the God of war, hee is expressed with a dart, thus. ♂.

Sol is the light and lamp of heauen, and giues life naturall to all thinges, hee is an indifferent Planet moderately hot and drye, masculine of the day, fortunate by aspect, but infortunate by corporall coniunction. He rules of mans bodye, the braine, the marrow, the ioyntes, the right eye of a man, and the left eye of a woman. Of colors, deepe yellow or golde colour. He signifieth Kings, princes, magistrates, famous persons, desirous of honour, and ambitious. Also kingdomes empires, nobilitie, magnanimitie, fortitude, glory, rule, honor. The greatnesse of his body is 166. times so bigge as the earth, and somewhat more. The quantitye of his beames are 15. degrees. He passeth thorow the 12. signes in 365. dayes, and 6. houres almost his fewest yeares are 19. his meane yeares are 69. and a halfe: his greater yeares are 120. and his greatest yeeres are 146. & because he beares the image of Apollo, hauing a golden apple in his hand, therefore in that likenes, or by a round circle, hee is figured thus ⊙.

Venus is the lesser fortune, femenine of the night, colde and moyst, temporate, benevolent. Of mans bodye, she rules the throte, pappes, bellye, reine, matrix, loines, fat, spleene, and the buttoks. Of humours, fleame: of colours greene and whitish: she signifies of persons the faire conditioned, the mercifull, meeke, the fine, pleasant, and delightsome, the effeminate, louers, dancers, banqueters, Musicians and Poets. Also stabilitye,

iolity, loue, mercy, beauty, gifts of frendes and women, marriage, dowry, ornamentes, iewels, lust, and lechery. The greatneſſe of her body, is the 27. part of the earth. The quantity of her beames are 8. degrees. She endeth her courſe as dooth the ſunne, her ſeweſt yeares are 8. her meane yeares are 45. her greater yeares are 82. and her greateſt yeare are 151. And becauſe ſhe beareth two parts, one of Gold, and another of lead, ſhe is expreſt by a double draught thus ☽ or by a looking glaſſe which is more proper.

Mercurie is conuertible, good with the good, and bad with the bad, ſometime Maſculine and of the day, ſometime Femenine, and of the night, hotte with the hotte, and colde with the colde, moyſt with the moyſt, and drye with the drye planetes, as he is configured to any. He rules of mans body the mouthe, the tongue, the thoughts, the memorye, the handes, and the thighes. He ſignifieth of perſons, Philoſophers, Scriueners, Merchantes, Painters, deuiſers of ſubtilities, craftye, deceitfull, wauering, lying, proud and ſcornefull. Alſo all kinde of ſciences, buying, ſelling, contracts, honeſt ſtudies, denination, and curioſitye. Of colours, the ſkie colour, or the ſpeckled of many colours, The greatneſſe of his body is the 32000. part of the earth. The quantitye of his beames are 7. degrees. He makes his reuolution as the Sunne and Uenus. His ſeweſt yeares are 20. his meane 48. his greater yeares 76. and his greateſt yeares are 460. He is figured as it were wearing a hatte or wings, thus ☿ or elſe more properly by his charming rod that is inuironed with ſerpents.

Luna is naturally colde and moyſt, of the night Femenine, ſhe is the carier and deliuerer of the influence of all the Planetes thorow her Orb vnto

ys. She rules the left eie of a man, and the right eye of a woman, and of booth, the stomacke, the taste, the liuer the belly, and the left side. She signifieth noble women, widdowes, the vulgar sort, and those of continuall motion, as Mariners, Messengers, Legats, and vagabonds. Also all things that abound in moysture, the sea, the ryuers, with their ebs and floods, the studies of histories, Embassages, Nauigation, iourneying, seruice, planting, sowing, and al water workes. Of humours the fleame, of colours, white or siluer colour. The greatnes of her body, is ỳ 39. part of the earth. The quantity of her beames are 12. degrees: she makes her passage through the Zodiacke in 27. dayes, and 8 houres, and ouertakes the Sunne in 29. dayes, 12. houres, or there about. Her lewest yeares are 25. her meane yeares are 66. and a halfe, her greater yeares are 108. and her greatest yeares are 520. and because she is commonly seene horned, or halfe round, she is figured thus ☾.

The Dragons heade, (which is the intersection made by the cutting or crossing lines of the Orbes of the Sunne or moone) is good with the good, and badde with the badde, for if it be ioyned with good Planets, it augmenteth their goodnesse, and ioyned with the euill, it dooth increase the malice and euill nature of them, and is figured thus ☊.

The Dragons tayle, which as it is the opposite point to the heade, so it is contrary in nature, for with the good it is bad, and with the bad it is good, for with whomesoeuer it is ioyned it dooth diminish the operation of them, be it good or badde, and is expressed thus ☋

The

Vniuersitie Colledge, founded by Alured, king of the Saxons, in the yeare of our Lord 872. Vniuersity colledge.

2 Bayly colledge, founded by John Balliol, king of the Scots, in the yeare of our Lord 1263. Baillioll colledge.
